1 Introduction

This paper uses data from Jacob Phillip’s website for Project Hammer which aims to reduce collusions and increase competitiveness in the Canadian Grocery sector. The dataset reveals information about the prices over time as observed from the timestamps of when the data was collected, which can be used to deduce how frequently items went on sale. The old (before-sale) price as displayed on the product can be compared to the new price to determine how much each product has been marked-down by for each vendor.

Estimand paragraph

Results paragraph

This is an important topic as it helps new vendors understand which products they should be marking-down for sales and the reasoning behind this. Governments can also make better deductions and predictions about which types of households are most affected during times of deflation or when prices fall based on the typical basket of good they purchase and which frequently marked-down product(s) are included in this. Pricing strategy is a complex topic and could vary between vendors, but if the same few items are consistently marked-down during sales, there must be a deeper-rooted reasoning behind it.

Telegraphing paragraph: The remainder of this paper is structured as follows. Section 2....

2 Data

2.1 Overview

We use the statistical programming language R (R Core Team 2023).... Our data (Toronto Shelter & Support Services 2024).... Following Alexander (2023), we consider...

Overview text

2.2 Measurement

Some paragraphs about how we go from a phenomena in the world to an entry in the dataset.

2.3 Outcome variables

Add graphs, tables and text. Use sub-sub-headings for each outcome variable or update the subheading to be singular.

Some of our data is of penguins (Figure 1), from Horst, Hill, and Gorman (2020).

Figure 1: Bills of penguins

Talk more about it.

And also planes (Figure 2). (You can change the height and width, but don't worry about doing that until you have finished every other aspect of the paper - Quarto will try to make it look nice and the defaults usually work well once you have enough text.)

Talk way more about it.

Figure 2: Relationship between wing length and width

2.4 Predictor variables

Add graphs, tables and text.

Use sub-sub-headings for each outcome variable and feel free to combine a few into one if they go together naturally.

3 Model

The goal of our modelling strategy is twofold. Firstly,...

Here we briefly describe the Bayesian analysis model used to investigate... Background details and diagnostics are included in [Appendix B](#).

3.1 Model set-up

Define y_i as the number of seconds that the plane remained aloft. Then β_i is the wing width and γ_i is the wing length, both measured in millimeters.

$$y_i | \mu_i, \sigma \sim \text{Normal}(\mu_i, \sigma) \quad (1)$$

$$\mu_i = \alpha + \beta_i + \gamma_i \quad (2)$$

$$\alpha \sim \text{Normal}(0, 2.5) \quad (3)$$

$$\beta \sim \text{Normal}(0, 2.5) \quad (4)$$

$$\gamma \sim \text{Normal}(0, 2.5) \quad (5)$$

$$\sigma \sim \text{Exponential}(1) \quad (6)$$

We run the model in R (R Core Team 2023) using the `rstanarm` package of Goodrich et al. (2022). We use the default priors from `rstanarm`.

3.1.1 Model justification

We expect a positive relationship between the size of the wings and time spent aloft. In particular...

We can use maths by including latex between dollar signs, for instance θ .

4 Results

Our results are summarized in Table 1.

5 Discussion

5.1 Correlation vs. Causation

Understanding the distinction between correlation and causation is essential for accurate analysis and responsible decision-making. Correlation indicates an association between two variables that tend to move together, but it does not imply that one causes the other. Causation, however, is a cause-and-effect relationship where changes in one variable directly lead to changes in another. Establishing causation often requires rigorous methods, such as controlled experiments, to rule out other influencing factors and confirm the direct link between variables.

Misinterpreting correlation as causation can lead to incorrect conclusions and ineffective policies or actions. By recognizing that correlation does not automatically mean causation, researchers and analysts can avoid drawing unwarranted inferences and instead base conclusions on solid, evidence-backed relationships. Distinguishing between these concepts ensures more accurate data interpretation and more effective decisions across various fields.

Table 1: Explanatory models of flight time based on wing width and wing length

	First model
(Intercept)	1.12 (1.70)
length	0.01 (0.01)
width	−0.01 (0.02)
Num.Obs.	19
R2	0.320
R2 Adj.	0.019
Log.Lik.	−18.128
ELPD	−21.6
ELPD s.e.	2.1
LOOIC	43.2
LOOIC s.e.	4.3
WAIC	42.7
RMSE	0.60

5.2 Missing Data

Please don't use these as sub-heading labels - change them to be what your point actually is.

5.3 Sources of Bias

5.4 Weaknesses and next steps

Weaknesses and next steps should also be included.

Appendix

A Additional data details

B Model details

B.1 Posterior predictive check

In Figure 3a we implement a posterior predictive check. This shows...

In Figure 3b we compare the posterior with the prior. This shows...

(a) Posterior prediction check

(b) Comparing the posterior with the prior

Figure 3: Examining how the model fits, and is affected by, the data

B.2 Diagnostics

Figure 4a is a trace plot. It shows... This suggests...

Figure 4b is a Rhat plot. It shows... This suggests...

Figure 4: Checking the convergence of the MCMC algorithm
